

In Lab Task 1

Write a JS program which takes in a Student ID, Name and course via a basically styled form. When the 'Store Student Details' button is clicked, store the student details to local storage, using the student ID as a key.

When the 'Retrieve Student Details' button is clicked, retrieve all student details and display. When the 'Clear Student Details' button is clicked, clear all details.

In Lab Task 2

Alter the Basic Drag and Drop code so that you add a second <div> and can drag items into either <div>, or from one <div> to another. **The first thing to do is to add a second <div> and then test your code.**

In Lab Task 3

Alter the TextDragAndDropAndStoreRetrieve program so that it will work on an image, one image only. That is, you can drop an image into the placeholder (instead of <pre> use <div>)

In Lab Task 4

See if you can get the above program working for multiple images
